

Features

- 500-mA-Rated Collector Current(single output)
- High-Voltage Outputs: 50V
- Output Clamp Diodes
- Inputs Compatible With Various Types of Logic
- Relay-Driver Applications

General Description

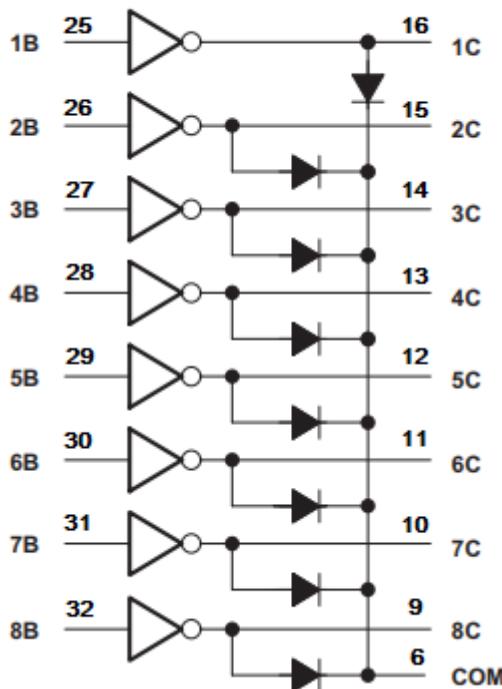

The XR2050 is high-voltage high-current Darlington transistor arrays each containing eight open collector common emitter pairs. Each pair is rated at 500mA. Suppression diodes are included for inductive load driving, the inputs and outputs are pinned in opposition to simplify board layout.

These devices are capable of driving a wide range of loads including solenoids, relays, DC motors, LED displays, filament lamps, thermal print-heads and high-power buffers.

The XR2050 is available in both a small outline QFN-5*5-32L package.

Functional Block Diagram

Note: All resistor values shown are nominal.

The collector-emitter diode is a parasitic structure and should not be used to conduct current. If the collector(s) go below ground an external Schottky diode should be added to clamp negative undershoots.

Absolute Maximum Ratings ⁽¹⁾

At 25°C free-air temperature (unless otherwise noted)

Symbol	Parameter	Min	Max	Unit
V_{CC}	Collector to emitter voltage	--	50	V
V_R	Clamp diode reverse voltage ⁽²⁾	--	50	V
V_I	Input voltage ⁽²⁾	--	30	V
I_{CP}	Peak collector current	--	500	mA
I_{OK}	Output clamp current	--	500	mA
I_{TE}	Total emitter-terminal current	--	-2.5	A
T_A	Operating free-air temperature range	-30	+105	°C
θ_{JA}	Thermal Resistance Junction-to-Ambient ⁽³⁾	--	63	°C/W
θ_{JC}	Thermal Resistance Junction-to-Case ⁽⁴⁾	--	12	
T_J	Operating virtual junction temperature	--	150	°C
T_{STG}	Storage temperature range	-40	150	°C

Note:

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the emitter/substrate terminal E, unless otherwise noted.
- (3) Maximum power dissipation is a function of T_J (max), θ_{JA} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\max) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
- (4) Maximum power dissipation is a function of $T_J(\max)$, θ_{JC} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\max) - T_A)/\theta_{JC}$. Operating at the absolute maximum T_J of 150°C can affect reliability.

Recommended Operating Conditions
